RESEARCH	Synthetic Memory Note: A Dated Web Page
September 14, 2026	A one-line standfirst for the invented page.

Conventional DRAM contract prices are projected to rise 14% QoQ in 4Q26 in our synthetic model, the third consecutive quarterly increase.

HBM shipments are projected to grow 35% YoY in 2026 as accelerator volumes ramp, while the share of HBM in total DRAM revenue climbs above one third.

Server DRAM inventory at the hyperscalers fell to four weeks in 3Q26, the lowest level in our synthetic series, which leaves little buffer against further demand surprises.

Memory makers' capital expenditure is projected to rise 20% in 2026, with most of the increase directed at advanced DRAM nodes and HBM packaging capacity.
